

- Project Manager can have 0 projects but project always has project manager
- Project has at least one release otherwise it is not project. release always has project
- Release has at least one feature otherwise it is meaningless to release. feature always has release to be delivered
- Developer can have 0 features to work on if he/she is new to the project. Feature can be created and wait to be assigned to developer

- Once project is gone, the release is meaningless so it is composition

- Once release is deleted, the related feature can be released with another release so it is aggregation
